

## INSTALLATION INSTRUCTIONS COLD WATER BALANCING VALVE ASSEMBLIES CSUA-CW & CSUAS-CW

- 1) Install assembly with proper flow direction as marked on valve body. This is critical with CircuitSolver® Union Cold Water Assemblies assemblies that have an integrated check valve.
- 2a) Use suitable pipe thread sealant rated for domestic water applications on all male pipe threads; if using PTFE sealant tape, make sure not to apply tape to the first thread to avoid cutting the PTFE tape and causing potential obstructions to flow.
- 2b) **How to apply PTFE Tape:**
  1. Clean the male and female threads of any oil or dirt.
  2. Apply tape to the male threaded end in a clockwise direction starting one thread back from the end. Hold on to one end of the tape, and wrap the threads three to six times, keeping it tight.
  3. Once the threads are completely wrapped, grab the tape with your thumb and index finger and snap it off.

**NOTE:** Upon tightening the assembly, verify that the shutoff valves are oriented so that their handles are accessible and can be operated fully without obstruction. If a reorientation after final installation is needed, loosen the **CircuitSolver® Union Nut** to rotate the section so as to not disturb the tightened components and possibly cause a leaky connection.

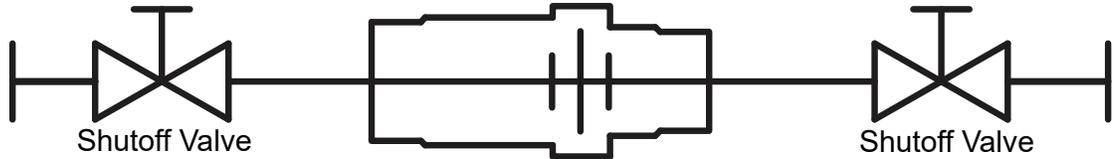

Scan to watch a quick tutorial video  
on proper reorientation instructions.

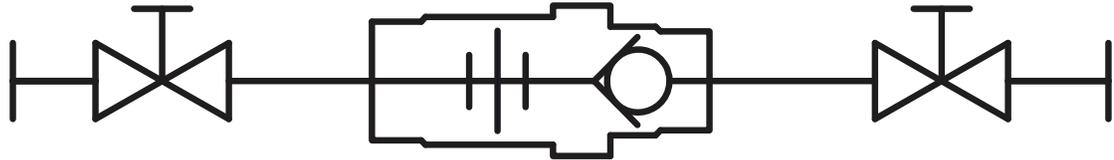

- 3) **CircuitSolver® Union Cold Water Assemblies** are designed to be installed at the end of each domestic cold water supply just prior to the return line.
- 4) For water systems with particulate/dirt problems, consider using the **CircuitSolver® Union Cold Water Assembly** with integrated strainer (Model CSUAS-CW) if a strainer is not already used upstream.  
\*Strainer must be maintained in order to avoid flow obstruction.
